## Abstract

---

The Hostel Management System is a project developed to simplify and streamline the tasks involved in managing a hostel. Built with a user-friendly interface using Python and supported by a PostgreSQL database, this system enables hostel administrators to handle student registrations, assign rooms, track fee payments, and generate useful reports.

The goal of the project is to provide a practical solution that replaces manual record-keeping with a digital system that is efficient, secure, and easy to use. Key features include secure login, organized student and room management, and an overview of payments, all designed to help administrators manage hostel operations smoothly.

## System Requirements

---

Component	Specification
Hardware	Standard desktop or laptop (Min: 4GB RAM, 5GB Free Disk Space)
Operating System	Windows 10 or 11 / Ubuntu 22.04
Database	PostgreSQL (v16+)
Language	Python (v3.12.10)
Libraries	tkinter, datetime, psycopg2

Table 1: Hardware and Software Requirements

## Database Design

---

The PostgreSQL database is structured with several tables, including a Student table for storing personal details and assigned room numbers, a Room table that maintains room availability and capacity, and a Payment table for tracking fee payments. An additional User table stores credentials for role-based access to ensure secure login. This relational database design supports complex data operations while maintaining data integrity and accessibility.

## Normalized Schemas

---

The database is normalized to ensure data integrity. The schema definitions are as follows:

1. **Person** (aadhar, name, age, dob, mobile, house\_no, house\_name, street, pincode)
2. **Pincode** (pincode, district)
3. **District** (district, state)
4. **State** (pincode, state)
5. **Hosteller** (aadhar, guardian\_mob, join\_date)
6. **Guardian** (guardian\_mob, guardian\_name)
7. **Staff** (aadhar, role)
8. **Room** (Room\_no, building\_no, floor, bed\_count, wifi\_available, bath\_attached, ac\_available)
9. **Gets** (aadhar, room\_no, building\_no)
10. **Bill** (Bill\_no, amount, issue\_date, paid\_date)
11. **Bill\_Issue** (issue\_date, due\_date)
12. **Pays** (Bill\_no, aadhar)
13. **Complaint** (Complaint\_no, Date, Status, Message, type)
14. **Raises** (Complaint\_no, aadhar)
15. **Deals\_with** (complaint\_no, aadhar)
16. **Mess** (Food\_id, Food\_name)
17. **Food** (Food\_name, Food\_type)
18. **Attends** (aadhar, Food\_id, Date, time)
19. **Notice** (notice\_no, message, date)
20. **Issues** (notice\_no, aadhar)
21. **Login** (username, person\_type, password, last\_login)
22. **Access** (aadhar, username)

## GUI Design

The Tkinter-based GUI is organized into different windows for various operations. A login screen appears first, guiding users to the dashboard after successful authentication. The main dashboard provides options for managing students, rooms, payments, and reports.

Forms are designed for easy data entry, updating, and deletion, with clear prompts and buttons for navigation. Separate windows for report generation display summarized data in tables and offer options for exporting if needed. Overall, the interface is intuitive, guiding users through tasks with minimal learning curve.

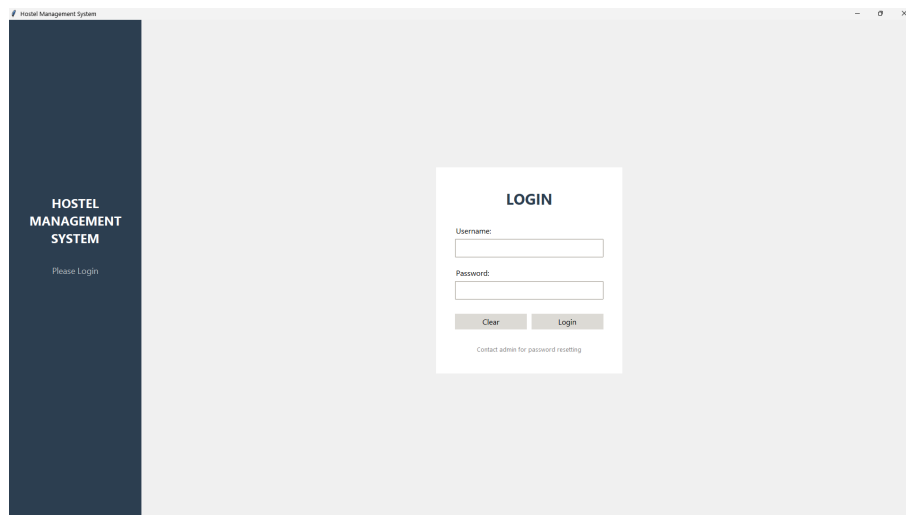

Figure 2: Login Page

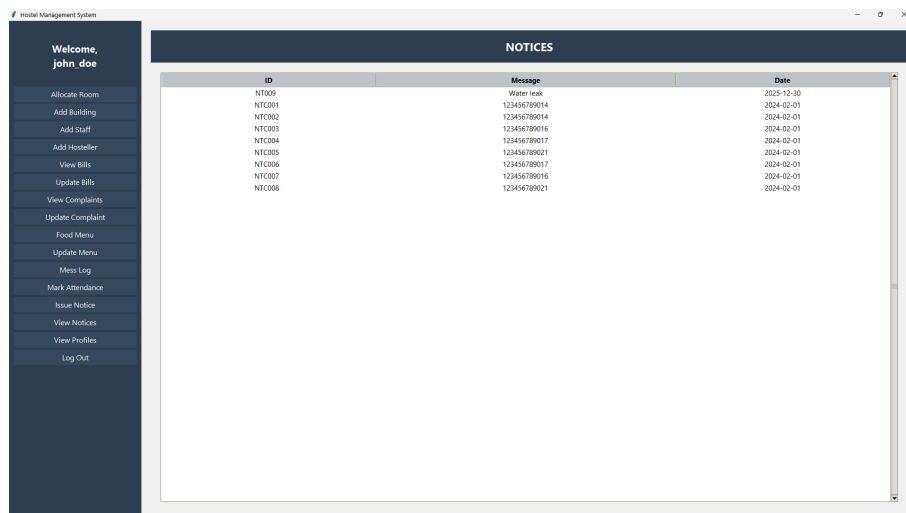

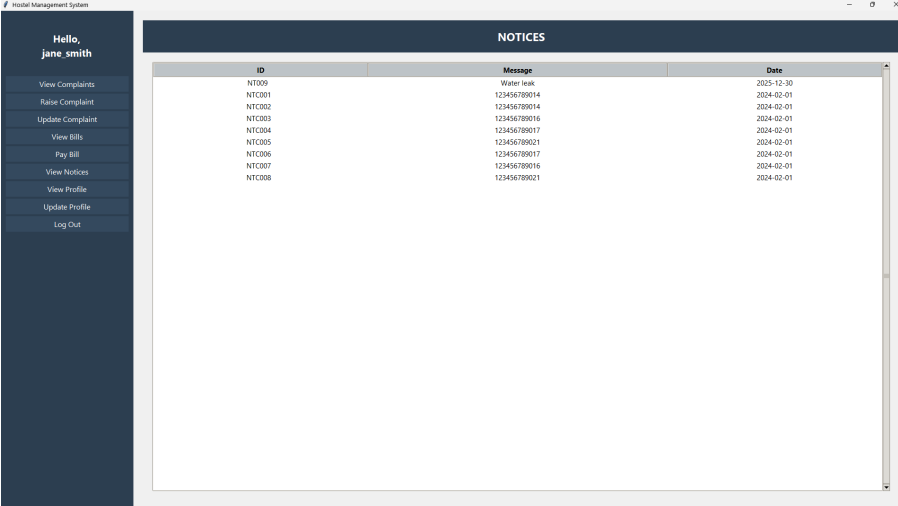

Figure 3: Staff Management Panel

The screenshot displays the 'Hosteller Management Panel' interface. On the left is a dark sidebar with the user's name 'Hello, jane.smith' and a list of navigation links: View Complaints, Raise Complaint, Update Complaint, View Bills, Pay Bill, View Notices, View Profile, Update Profile, and Log Out. The main content area features a 'NOTICES' table with three columns: ID, Message, and Date. The table contains eight rows of data, including notices about water leaks and bills.

ID	Message	Date
NTC009	Water leak	2025-12-30
NTC001	123456789014	2024-02-01
NTC002	123456789014	2024-02-01
NTC003	123456789016	2024-02-01
NTC004	123456789017	2024-02-01
NTC005	123456789021	2024-02-01
NTC006	123456789017	2024-02-01
NTC007	123456789016	2024-02-01
NTC008	123456789021	2024-02-01

## Conclusion

In conclusion, this Hostel Management System provides an effective solution for hostel administration by automating core tasks, reducing paperwork, and enhancing data accuracy.

In the future, this system could be enhanced with additional features such as automated email or SMS notifications to remind residents of pending payments and a web-based interface for remote access by administrators and students. Incorporating analytics dashboards to visualize trends in occupancy and revenue could also add value for hostel management, enabling better data-driven decision-making.
